

Codebook: Red Wine Quality Dataset

Source:

Kaggle – Wine Quality Dataset

<https://www.kaggle.com/datasets/yasserh/wine-quality-dataset?resource=download>

Description:

Dataset contains physicochemical measurements of red wine samples, along with a quality score assigned to each wine. Each row represents a different wine sample, and each column represents a variable used in the analysis.

Number of Observations: 1,143

Number of Variables: 13 (Used 12 after removing ID)

Variable Descriptions:

fixed.acidity (numeric)

- Concentration of non-volatile acids in the wine

volatile.acidity (Numeric)

- Amount of acetic acid in the wine; high values may cause a vinegar taste

citric.acid (Numeric)

- Amount of citric acid, which contributes to freshness and flavor

residual.sugar (Numeric)

- Amount of sugar remaining after fermentation

chlorides (Numeric)

- Amount of salt present in the wine

free.sulfur.dioxide (Numeric)

- Free sulfur dioxide available to prevent oxidation and microbial growth

total.sulfur.dioxide (Numeric)

- Total sulfur dioxide (free + bound forms)

density (Numeric)

- Density of the wine, related to sugar and alcohol content

pH (Numeric)

- Measure of acidity/basicity

sulphates (Numeric)

- Additives that can contribute to preservation and flavor

alcohol (Numeric)

- Alcohol content of the wine

quality (Numeric)

- Quality score of the wine (response variable)

id (Numeric)

- Identifier for each observation (removed for analysis)
